INDIA'S FIRST GRID FOUNDATION MODEL

India's entire power grid, in one model you can ask.

Hundreds of scattered public data sources, fused into a single model of the Indian grid that updates continuously. **Use it online through Claude and ChatGPT, or run a private copy behind your own firewall.**

- Hundreds of sources, one model
- Every place, every time-step
- Runs offline, behind your firewall

44,388
transmission lines mapped, 33 kV to 765 kV

28,251
substations, at every voltage level

5,101
power plants, across all fuel types

15 min
resolution on market prices and grid frequency

How it works

From scattered public data to a model your engineers can question

1 COLLECT

Hundreds of data sources

Grid operators, regulators, exchanges, utilities, weather and maps. Gathered, cleaned and reconciled for you.

Demand · Prices · Tariffs · Substations · Lines · Weather

→

2 MODEL

Grid Foundation Model

Where everything is and how it behaves over time. Always refreshing.

Spatial	plants, lines, substations
Temporal	demand, prices, weather
Integrated	one consistent network

→

3a Online

Ask in plain English inside **Claude**, **ChatGPT** and other AI tools, or call the API. Free to start.

3b Behind your firewall

Host a full copy on your own servers. **No internet needed.** Your data never leaves the building.

WHY IT MATTERS

Grid studies that cost lakhs and take months. Now a question you can ask.

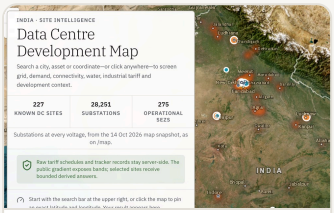

Most of the cost of an energy study is the hundreds of hours spent finding, cleaning and stitching data together before the first simulation runs. The Atlas model has already done that work, for the whole country.

What your team can run

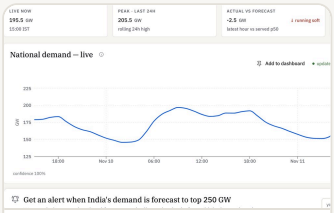

Siting studies

Where can a new plant or large load connect? See firm capacity by station before you commit to land.

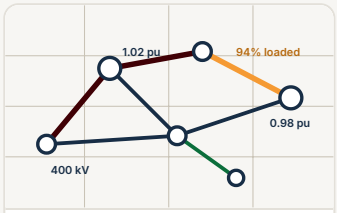

Data centre impact

Screen sites on grid, fibre, water and tariff, and test what a new campus does to the local network.

Production cost

Simulate how the system dispatches hour by hour, and what it means for costs, prices and emissions.

AC power flow

Check line loadings and voltages on the real network, including when a line or transformer is out.

Screens from the live platform at energymap.in, November 2026. Network diagram is illustrative.

What changes

THE USUAL WAY

- **Hundreds of hours** collecting data from scattered portals
- **Lakhs of rupees** for each simulation or consultant study
- Sensitive project details sent to outside vendors
- Results are stale by the time the report lands

→

WITH THE ATLAS MODEL

- **Data is already in.** Run study after study, in-house
- **Nothing leaves your network** on a private deployment
- **Always current.** The model keeps updating
- **Answers link back to sources** you can check

Two ways to use it

ATLAS ONLINE

Served over the internet

Best for	Analysts, researchers and teams getting started
Access	**Claude, ChatGPT**, web app and API
Updates	Continuous. Always the latest model
Setup	None. Sign up free at energymap.in

ATLAS ENTERPRISE

Your own copy, behind your firewall

Best for	Utilities, developers, data centre operators
Access	Runs on **your servers**, with your internal AI tools
Internet	**Not required.** Works fully isolated
Your data	Stays inside, alongside your confidential data

How enterprises work with us

1 — Try it online

Your team asks real questions on the public model. No cost, no commitment.

2 — Scope together

We agree on the studies, regions and internal systems that matter to you.

3 — Deploy privately

A copy of the model is installed inside your network, isolated from the internet.

4 — Run your studies

Your engineers run siting, cost and power flow work in-house, on demand.
